the massively parallel processor pdf
In computing, massively parallel refers to the use of a large number of processors (or separate computers) to perform a set of coordinated computations in parallel (simultaneously).. In one approach, e.g., in grid computing the processing power of a large number of computers in distributed, diverse administrative domains, is opportunistically used whenever a computer is available.

Massively parallel - Wikipedia
Parallel computing is a type of computation in which many calculations or the execution of processes are carried out simultaneously. Large problems can often be divided into smaller ones, which can then be solved at the same time. There are several different forms of parallel computing: bit-level, instruction-level, data, and task parallelism. ...

A Java â„¢ Parallel Calamity. Javaâ„¢ SE 8 supports parallel bulk operations (filter/map/reduce.) This is great news for application developers who have wanted parallel operations to compete with C# in this area. Unfortunately, the parallel engine that supports this feature is fatally flawed.
